

Cynthia Keppel is the Hall A and C Group Leader at the Thomas Jefferson National Accelerator Facility (JLab), and a spokesperson for twelve JLab electron scattering experiments focusing on quark-hadron duality, precision longitudinal/transverse separation experiments, and nucleon and meson structure in particular at large parton momentum fraction. She is an active member of the Coordinated Theoretical-Experimental Project on QCD (CTEQ), and has also worked on the MINERvA experiment at the Fermi National Accelerator Facility. Dr. Keppel holds six patents for nuclear medicine and radiation therapy technologies, and served as the Scientific and Technical Director of the Hampton University (HU) Proton Therapy Institute, while holding a joint position as University Endowed Professor of Physics at HU and Staff Scientist at JLab. She received her Ph.D. in 1995 from the American University for research at the Stanford Linear Accelerator Center. As a joint JLab/HU faculty member she was awarded a National Science Foundation CAREER grant, a 2011 Virginia Outstanding Scientist Award, and attracted and managed as Principal Investigator over \$35M in extramural research support. She has served on numerous national and international committees, and as Director of the Hampton University Graduate Studies (HUGS) at Jefferson Lab Summer School for a decade. She is an author of over 160 peer-reviewed publications, including two invited review articles.
